

Climb up Interceptors

The ClimB-up Insect Interceptor is an intuitive bed bug monitor and trapping device that can play an important and crucial role in the fight against bed bugs.

Bed Bug Climb Up Interceptors are simple pitfall traps that can be placed under the legs and feet of couches and chairs, bed posts, or other posts and legs of furniture where people rest or sleep.

Bed Bugs in other parts of the infested dwelling will travel in search of a blood meal and can be intercepted and trapped in the ClimB-up Interceptor as they attempt to gain access to the beds or other furniture that have the interceptor devices installed.

This is an excellent and inexpensive way to keep a bed or couch free from bed bug infestation, monitor an existing bed bug problem, or to detect a new bed bug infestation.
